

## Homework 5: Balanced Trees and Transform-and-Conquer

1. Show how the red-black tree would look after inserting a node with the key 0043. Use the document on Moodle that explains the insertion process succinctly. List the case you applied (i.e. 1, 2a, 3b), and write the steps you took to fix the tree (also listed in the document).

Figure 1: Original Red Black Tree

- a. Draw the tree after a regular binary search tree insertion. (3 points)
- b. Which property is violated?

If a node is red, then both its children are black.

Case seen after regular binary search tree insertion: case 2b

Steps taken to fix tree:

- $z = \text{parent}(z)$
- right rotate about  $z$ , or 0045

- b. Which property is violated?

If a node is red, then both its children are black.

Figure 2: Inserted 43

Figure 3: First fix

Case seen after regular binary search tree insertion: case 3b

- `parent(z).color = black`
- `parent(parent(z)).color = red`
- left rotate about `parent(parent(z))`, or 0040

Figure 4: Second fix

2. Draw the 2-3 tree after inserting each of the following keys. Redraw the tree for each part.

a. add 50

b. add 76

c. add 23

d. add 21

e. add 20

f. add 19

g. add 18

3. write pseudocode for lcm - doing python

```
def gcd(a, b):  
    if (a == 0):  
        return b  
    return gcd(b % a, a)
```

```
def lcm(A):  
    if len(A) < 2:  
        return None
```

Figure 5: add 50

Figure 6: add 76

Figure 7: add 23

Figure 8: add 21

Figure 9: add 20

Figure 10: add 19

Figure 11: add 18

```

res = A[0]
for i in range(1, len(A)):
    res = res * A[i] / gcd(res, A[i])
return res

```

4. Horner's method

$$p(x) = 4 \cdot x^4 + 5 \cdot x^3 - 2 \cdot x^2 - 4 \cdot x + 7$$

a. repeatedly factor out x for the polynomial so that you can apply the method

- $p(x) = x \cdot (4 \cdot x^3 + 5 \cdot x^2 - 2 \cdot x - 4) + 7$
- $p(x) = x \cdot (x \cdot (4 \cdot x^2 + 5 \cdot x - 2) - 4) + 7$
- $p(x) = x \cdot (x \cdot (x \cdot (4 \cdot x + 5) - 2) - 4) + 7$
- $p(x) = x \cdot (x \cdot (x \cdot (x \cdot (4) + 5) - 2) - 4) + 7$

b. show values of the array P[n]

$$P = [7, -4, -2, 5, 4]$$

c. apply Horner's method to evaluate the polynomial at x=2, using the table below:

x	p	n	i
2	4	4	4
	13		3
	24		2
	44		1
	95		0

$$p(2) = 95$$

d. Use synthetic division to divide p(x) by x - 2

$$p(x) = 4 \cdot x^4 + 5 \cdot x^3 - 2 \cdot x^2 - 4 \cdot x + 7 \div x - 2$$

$$2 \mid 4 \ 5 \ -2 \ -4 \ 7 \ 8 \ 26 \ 48 \ 88 \quad \text{---} \quad 4 \ 13 \ 24 \ 44 \ 95$$

$$\frac{p(x)}{x-2} = 4 \cdot x^3 + 13x^2 + 24x + 44 + \frac{95}{x-2}$$

5. left right binary exponentiation

```

def left_right_binary_exponentiation(a, B):
    prod = 1
    for i in range(len(B), 0, -1):
        if i == len(B):
            prod = a
            continue
        prod *= prod
        if B[i] == 1:

```

```
    prod = prod * a  
    return prod
```
